13. ABSTRACT. This Software Reference documents and summarizes all source code produced for a Ph.D. dissertation constructing an underwater virtual world for an Autonomous Underwater Vehicle (AUV).

A critical bottleneck exists in Autonomous Underwater Vehicle design and development. It is tremendously difficult to observe, communicate with and test underwater robots, because they operate in a remote and hazardous environment where physical dynamics and sensing modalities are counterintuitive.

An underwater virtual world can comprehensively model all salient functional characteristics of the real world in real time. This virtual world is designed from the perspective of the robot, enabling realistic AUV evaluation and testing in the laboratory. Three-dimensional real-time computer graphics are our window into that virtual world.

Visualization of robot interactions within a virtual world permits sophisticated analyses of robot performance that are otherwise unavailable. Sonar visualization permits researchers to accurately "look over the robot's shoulder" or even "see through the robot's eyes" to intuitively understand sensor-environment interactions. Extending the theoretical derivation of a set of six-degree-of-freedom hydrodynamics equations has provided a fully general physics-based model capable of producing highly non-linear yet experimentally-verifiable response in real time.

Distribution of underwater virtual world components enables scalability and real-time response. The IEEE Distributed Interactive Simulation (DIS) protocol is used for compatible live interaction with other virtual worlds. Network connections allow remote access, demonstrated via Multicast Backbone (MBone) audio and video collaboration with researchers at remote locations. Integrating the World-Wide Web allows rapid access to resources distributed across the Internet.

ABSTRACT

This Software Reference documents and summarizes all source code produced for a Ph.D. dissertation constructing an underwater virtual world for an Autonomous Underwater Vehicle (AUV).

A critical bottleneck exists in Autonomous Underwater Vehicle (AUV) design and development. It is tremendously difficult to observe, communicate with and test underwater robots, because they operate in a remote and hazardous environment where physical dynamics and sensing modalities are counterintuitive.

An underwater virtual world can comprehensively model all salient functional characteristics of the real world in real time. This virtual world is designed from the perspective of the robot, enabling realistic AUV evaluation and testing in the laboratory. Three-dimensional real-time computer graphics are our window into that virtual world.

Visualization of robot interactions within a virtual world permits sophisticated analyses of robot performance that are otherwise unavailable. Sonar visualization permits researchers to accurately "look over the robot's shoulder" or even "see through the robot's eyes" to intuitively understand sensor-environment interactions. Extending the theoretical derivation of a set of six-degree-of-freedom hydrodynamics equations has provided a fully general physics-based model capable of producing highly non-linear yet experimentally-verifiable response in real time.

Distribution of underwater virtual world components enables scalability and real-time response. The IEEE Distributed Interactive Simulation (DIS) protocol is used for compatible live interaction with other virtual worlds. Network connections allow remote access, demonstrated via Multicast Backbone (MBone) audio and video collaboration with researchers at remote locations. Integrating the World-Wide Web allows rapid access to resources distributed across the Internet.

This dissertation presents the frontier of 3D real-time graphics to support underwater robotics, scientific ocean exploration, sonar visualization and worldwide collaboration.

ACKNOWLEDGEMENTS

Many people helped in this work. Mike Zyda is the best dissertation advisor anyone might hope for. His insight, support and enthusiasm are boundless. Bob McGhee and Tony Healey showed unlimited patience and insight as we explored the frontiers of dynamics modeling. Mike Bailey taught me analytical and discrete event simulation. He and Man-Tak Shing also gave valuable advice on the Ph.D. process. Mike Macedonia's unparalleled understanding of computer networks helped make an entire field intelligible.

Dave Pratt blazed the trail with NPSNET, still the best virtual world around and still improving faster than all the others. Dave provided crucial academic advice and also the financial support which made the *SIGGRAPH 94* exhibit at *The Edge* possible. I am indebted to everyone who helped make that weeklong demonstration possible, especially Shirley Isakari Pratt, John Roesli, Frank Tipton, Jim Vaglia, Matt Johnson, Chris Stapleton, Garry Paxinos, Jackie Ford Morie, Theresa-Marie Rhyne, Paul Barham, John Locke, Steve Zeswitz, Rosalie Johnson, Russ and Sue Whalen, Walt Landaker, Dave Marco, Mike Williams, Terry Williams, Hank Hankins and Hollis Berry. I also thank Peter Purdue, Gordon Bradley, Jim Eagle, Ted Lewis, Mike McCann, Bruce Gritton, Mike Lee, David Warren, Dave Norman, John Sanders, Dick Blidberg, SeHung Kwak, Ron Byrnes, Drew Bennett, Jim Bales, Jim Bellingham, Alan Beam, Claude Brancart, Rodney Luck, John Gambrino, and Larry Ziomek for their help. Support for this research was provided in part by the National Science Foundation under Grant BCS-9306252 to the Naval Postgraduate School.

This work is dedicated with love and thanks to my wife Terri and our children Hilary, Rebecca, Sarah and Patrick.

SOFTWARE REFERENCE

A Virtual World for an Autonomous Underwater Vehicle

TABLE OF CONTENTS

LIST OF FIGURES

I. INTRODUCTION

The purpose of this guide is to document the source code developed in the creation of an underwater virtual world for an autonomous underwater vehicle (AUV). It is companion document to a dissertation (Brutzman 94). There are a number of parts to this work. First a users guide is presented which describes how to obtain and install the software described here. Key mission output files then show results produced by the autonomous underwater robot interacting with the virtual world. Remaining chapters present the source code developed for robot execution software, 3D computer graphics, six degree-of-freedom hydrodynamics, a geometric sonar model, networking, and hypermedia using the World-Wide Web and the Multicast Backbone (MBone).

Several languages are included in this source code. Robot execution programs and supporting configuration files are written in the Kernigan and Richie variant of the ***C*** language, and run identically under Irix 5.2 or OS-9 operating systems. Other source programs are written primarily in C++. Source code file name conventions use a *.c* extension for ***C*** language files, and a *.C* extension for ***C++*** language files. Remaining programs and files are written in languages specific to the application, such as *gnuplot* (Williams 95), Tool control language (*Tcl*) (Osterhout 94) (Welch 94), hypertext markup language (.html) (Berners-Lee 94a, 94b) (Hughes 94) or operating system shell scripts.

All of the programs described here are available electronically without charge to Internet users via anonymous ftp. The accompanying public electronic distribution of this reference includes both source code and compiled executable programs. All programs have been tested under SGI operating system Irix 5.2, and robot code has also been tested under operating system OS-9 version 2.3. Goals of the underwater virtual world project include making source code, applications and interfaces easily available in order to encourage scientific collaboration and educational use. Future

work includes porting virtual world viewers to a variety of operating systems and computer architectures.

An NPS AUV hypermedia home page has been prepared to facilitate examination and download of the various underwater virtual world components. This home page is available for interaction using any number of Internet-based browsers, most notably *Mosaic* (NCSA 94a). Resources on the home page include the electronic distribution, installation and execution instructions, pointers to related work, images, plots, papers and a variety of other media. World-Wide Web (WWW) Uniform Resource Locator (URL) for the NPS AUV home page is:

ftp://taurus.cs.nps.navy.mil/pub/auv/auv.html

To learn more about the World-Wide Web, consult "Entering the World-Wide Web (WWW): A Guide to Cyberspace" (Hughes 94). This paper describes everything needed to start using *Mosaic*, accessing all types of information sources, and using hypermedia and the Internet. *Mosaic* is a hypermedia browser that is freely available for Unix machines running X windows, Macintoshes and personal computers (PCs) running Windows. There are also free line mode browsers (such as *lynx* and *www*) that let you browse hypertext documents in a simple text mode using *any* computer which has an internet connection (Montulli 94) (Berners-Lee 94b).

The source code in this software guide is fully documented and reasonably self-explanatory. Graphics and hydrodynamics programs are written in the ANSI standard ***C***++ language, robot execution code and networking code is written in the Kernighan and Richie variant of the ***C*** language, plotting programs use *gnuplot* version 3.5 scripting language, and hypertext pages are written in standard Hypertext Markup Language (*.html*) (NCSA 94b). Despite extensive documentation, however, one programmer's clearly-written code may well be undecipherable to another programmer. Users are strongly encouraged to review the companion dissertation which derives the formulae and explains the concepts behind the software (Brutzman 94), retrieve the latest version of the underwater virtual world distribution, or contact the author for questions that remain unanswered. No guarantees of any

kind are implied. Many problems are open and progress occurs on a frequent basis when conducting research on robots and virtual worlds.

Hopefully this work will stimulate and encourage other research efforts to build large-scale virtual worlds in compatibly-extendable ways. Interested readers are encouraged to examine the AUV home page for project updates, read the documentation, and to contact the author regarding new uses of the software and potential research collaboration.

II. INSTALLATION, EXECUTION, CREATION AND REMOVAL

A. Introduction

The following Installation and Execution Guide is intended to enable any new user to download, install, execute and understand the NPS AUV Underwater Virtual World. Users may want to solely download the viewer software to observe an Internet-wide mission exercise, or run the entire set of programs making up the virtual world. Users of the robot execution program can enter their electronic mail address and receive a mission report following each mission. A sample mission report shows the mission script used for the canonical SIGGRAPH 94 mission, a project abstract, pointers to related work and the execution orders generated by the mission script. Mission reports are also available by "fingering" the home auv account, e.g.

finger auv@dude.cs.nps.navy.mil

Finally, shell script files for archive creation and removal are included to document automated archive maintenance.

B. *auv-uvw.INSTALL* Installation and Execution Guide

Table of Contents

     Distribution information
     System requirements
     Retrieving the distribution auv-uvw.tar.Z
     Installing the distribution auv-uvw.tar.Z
     MBone connection (optional but recommended)
     Information files
     Viewing remotely-executing robot missions via the MBone
     Running all of the virtual world components locally
     Plotting mission telemetry using gnuplot
     Recompiling virtual world component executables
     Killing multicast processes
     Removing the entire distribution
     Future work
     Contact information

  This is a big project!  I've tried to make this guide as concise and readable
  as possible.  However some work is necessary to read and absorb this material.

  Suggestions on how to further streamline the guide are very welcome.  Thanks!

//------------------------------------------------------------------------//

Distribution information

   For the latest greatest distribution, plus pointers to all of the supporting
   public domain programs, use Mosaic or a World-Wide Web line browser to
   connect to the NPS AUV home page:

        ftp://taurus.cs.nps.navy.mil/pub/auv/auv.html

   To retrieve the distribution directly:

        ftp://taurus.cs.nps.navy.mil/pub/auv/auv-uvw.tar.Z

   To receive a copy of a recent mission report:

     finger auv@dude.cs.nps.navy.mil

//------------------------------------------------------------------------//

System requirements

   The auv-uvw 'viewer' requires SGI Irix 5.2 or better with OpenInventor 2.0
     Execution Only Environment (inventor_eoe) installed.  This is provided
     free with all versions of Irix, it merely needs to be installed.
     You can tell if it is installed by typing 'versions' at the SGI prompt.
```

Modification and recompilation of the 'viewer' requires installation of
inventor_dev Inventor 3D Toolkit, 2.0 development option.
The virtual world 'viewer' is written in C++ using OpenInventor
graphics, and it also uses the NPSNET DIS 2.0.3 multicast libraries
(which are also included as source/binaries in this distribution).

The 'dynamics' virtual world software has been tested under Irix 5.2,
is written in C++, and also uses the NPSNET DIS 2.0.3 multicast
libraries. You should run it on a sound-equipped workstation for
best results.

The robot 'execution' code has been tested under Irix 5.2 and OS-9 v2.3
It is written in ANSI C with special #defines for OS-9 K&R C
compatibility, allowing it to be run without modifications either under
Irix or on the NPS Autonomous Underwater Vehicle 68030 microprocessor.
It ought to be portable to most any plain vanilla C compiler.

//--//

Retrieving the distribution auv-uvw.tar.Z

The easiest way is to retrieve & save the tar file is to point Mosaic at

ftp://taurus.cs.nps.navy.mil/pub/mosaic/auv.html

If instead you use anonymous ftp, here is a sample session:

```
unix>> ftp taurus.cs.nps.navy.mil
Connected to taurus.cs.nps.navy.mil.
220 taurus FTP server (Version 6.10 Wed Mar 18 11:57:03 PST 1992) ready.

Name (taurus.cs.nps.navy.mil:yourname): anonymous
331 Guest login ok, send e-mail address as password.
Password: your.email.address.here

ftp> cd pub/auv
250 CWD command successful.
ftp> binary
200 Type set to I.
ftp> get auv-uvw.tar.Z
local: auv-uvw.tar.Z remote: auv-uvw.tar.Z
150 Opening BINARY mode data connection for auv-uvw.tar.Z(4747669 bytes)
226 Transfer complete.
4747669 bytes received in 34.32 seconds (135.08 Kbytes/s)
ftp> quit
221 Goodbye.
```

The uncompressed distribution is about 10 MB, not counting the extra
recommended applications. The compressed distribution is about 5 MB.
Precise distribution sizes can vary when changes are incorporated.

//--//

Installing the distribution auv-uvw.tar.Z

Uncompress auv-uvw.tar.Z in your root directory by typing

```
unix:yourhome>     uncompress auv-uvw.tar.Z

unix:yourhome>     tar -xvf   auv-uvw.tar
```

Backup & update your MBone session directory configuration file .sd.tcl

```
   unix:yourhome>     cp  .sd.tcl          .sd.tcl.old

   unix:yourhome>     cp  .sd.tcl.auv-uvw  .sd.tcl
```

Edit the MBone tool aliases to include directory paths as appropriate.
They are located at the very end of the new file .sd.tcl

```
   unix:yourhome>     zip .sd.tcl
```

After editing, exit and restart session directory (sd):

```
   unix:yourhome>     sd
```

You can now run the viewer from an sd advertisment for the NPS AUV Underwater Virtual World (if there is one running - this is optional).

You will notice some auv-uvw information files in your root directory and several new directories:

```
   yourhome/auv-uvw/  OpenInventor viewer program & data files

   yourhome/execution/AUV (robot) execution level code and
                      mission scripts

   yourhome/dynamics/Virtual world for robot: dynamics, sonar
                      and other components

   yourhome/dynamics/speechText-to-speech audio files from mission
                      scripts.  These originate from queries
                      to the Say.. server
```

The auv-uvw distribution should now be fully installed.

```
//-------------------------------------------------------------------------//
```

MBone connection (optional but recommended)

Multicast Backbone (MBone) connectivity is needed if you want to participate in remote exercises. A good way to test your network's connectivity is to type 'sd' (session directory). If you get a menu of MBone programs starting to slowly build up, you are in business.

To receive Distributed Interactive Simulation (DIS) robot execution Protocol Data Units (PDUs) originating on your own network, you do not have to be connected to the Internet-wide MBone.

SGI's Irix 5.2 operating system supports multicast in the kernel, so you can still run the robot/virtual world programs on one machine & the auv-uvw viewer on another. Only one process per machine can grab the multicast port, thus at least 2 machines are needed to run everything.

To connect your system to the MBone takes some work but is worth it. You will need the involvement & support of your network administrator.

The following article tells why MBone is so great and how to connect:

```
    ftp://taurus.cs.nps.navy.mil/pub/mbmg/mbone.ps    (PostScript) or
    ftp://taurus.cs.nps.navy.mil/pub/mbmg/mbone.html  (hypertext)  or
    ftp://taurus.cs.nps.navy.mil/pub/mbmg/mbone.txt   (ASCII text)
```

Other installation pointers are on the NPS MBone home page at

ftp://taurus.cs.nps.navy.mil/pub/mosaic/mbone.html

Over a thousand subnets worldwide are already connected to the MBone. There are lots of people willing to help. In practice we've seen it take people between a few days and a few weeks to start using MBone, but once connected further work is rarely required. Good luck!

//--//

Information files:

auv-uvw.virtual-world.README (a mission report)
auv-uvw.virtual-world.INSTALL (this file)

others are listed in the mission report and the home page site

//--//

Viewing remotely-executing robot missions via the MBone

You must have MBone connectivity installed on your network for remote experiment observation. If the NPS AUV Underwater Virtual World is advertised in sd, and you have installed the distribution, just select the session and multicast ports are passed automatically to the viewer.

Alternatively, you can start the viewer manually from the command line:

```
unix:yourhome>     auv-uvw.viewer
 or    unix:yourhome/auv-uvw>viewer
```

The following command line switches are available with viewer:

```
-address 224.2.###.##multicast address as advertised in sd session
-port    #####     multicast wb port as advertised in sd session
```

The virtual world viewer should now run.

//--//

Running all of the virtual world components locally

Running a robot mission takes three processes and at least two machines. viewer and dynamics must be on different hosts, execution can run anywhere.

Notes regarding sd session advertisements are optional.

* First is the 'viewer' to get a window into the virtual world. Run this on your most capable Iris workstation - Reality Engines are nice! You can use or disable texturing based on the capabilities of the machine.

```
unix1>  cd auv-uvw
unix1>  viewer
```

The following optional command line switches are available with viewer:

```
-address 224.2.###.##multicast address as advertised in sd session
-port #####        multicast wb port as advertised in sd session
   -texture-on
   -texture-off
   -printdialog    pop up print dialog box for screen snapshots
   -noprintdialog
```

The virtual world viewer now runs.

* The 'dynamics' program is the virtual world connection for robot execution:
Run it on a sound-equipped workstation for best results, otherwise ignore any
sound-card-missing error messages. The 'dynamics' program is purely
text-based so graphics capabilities are irrelevant.

```
unix2>  cd dynamics
unix2>   dynamics

     Dynamics classes test selections
              L loop_test_with_execution_level ();
              M Multicast parameter input
              ttl=15, group address=224.2.121.93, port=3111
              O Ocean current vector reset  <0, 0, 0>
              H Hmatrix/quaternion exerciser
              R Rotation of quaternion & Hmatrix using p q r
              D Defaults
              I Invert matrix test
              E dEad_reckon_test_with_execution_level
              P PDU_skip_interval change (from 1)
              T Toggle TRACE = 0
              C DIS_net_close ();
              Q Quit
     Enter choice:
```

Select L for loop test with execution level

The following command line switches are available with dynamics program:

```
-ttl      #       time to live (be careful!) recommend 16 or less
-address 224.2.###.##multicast address as advertised in sd session
-port     #####   multicast wb port as advertised in sd session
-loop             start looping automatically
```

* Finally, 'execution' is the robot execution level software.
'execution' runs through the file 'mission.script' and gets
real world responses from the virtual world program 'dynamics'.
'execution' can run under Unix or real-time operating system OS-9.

```
unix3>   cd execution
unix3>   cp mission.script.the_one_you_want mission.script
unix3>   execution  remotehost unix1.host.name

     Enter your e-mail in the execution process window when asked.
```

See the file mission.script.HELP for info on how to write mission scripts.

//--//

Plotting mission telemetry using gnuplot

```
unix3:yourhome>    cd execution
unix3:yourhome/execution/>gnuplot  auv_plot.gnu
```

For fewer points plotted (1 per second) out of the same dataset:

```
unix3:yourhome/execution/>gnuplot  auv_plot_1_second.gnu
```

or use a postscript viewer (xpsview or ghostview) to look at plots directly:

```
unix3> xpsview   -wp -skipc -or landscape ~/execution/AUV_telemetry.ps &
 or  unix3> ghostview              -landscape ~/execution/AUV_telemetry.ps &
```

```
//-------------------------------------------------------------------------//

Recompiling virtual world component executables

   auv-uvw directory

     (Requires inventor_dev Inventor 2.0 development option installed.
      See system requirements section for details).

       unix3:yourhome/auv-uvw/>    make viewer

   dynamics directory

       unix3:yourhome/dynamics/>   make dynamics

   execution directory

       unix3:yourhome/execution/>  copy Makefile.SGI Makefile
       unix3:yourhome/execution/>  make execution

   or  OS-9: yourhome/execution/>  copy Makefile.OS9 Makefile
       OS-9: yourhome/execution/>  make execution

   Details on recompilation and modification are included in all source files.

//-------------------------------------------------------------------------//

Killing multicast processes

   Sometimes multicast processes (such as 'viewer' and 'dynamics') do not die
   cleanly because they have forked a second multicast process.
   viewer is especially prone to this behavior when invoked from session
   directory (sd), since sd must put the viewer process into the background.

   You may need to take special action to ensure the processes are killed.
   The following instructions will work on SGI machines:

   To put a process to sleep that refuses to let go of the command prompt:

     type a ^Z (control-Z) in the runaway process window

   To see what processes are running:

     unix> ps

   To see ALL processes that are running (including previous zombie processes):

     unix> ps -ea

   To kill a process:

     unix> kill -9 #### where #### is the Process ID (PID)

   An example log:

     [runaway process, you hit the control-Z key to suspend it]
     ^Z
     Suspended

     unix>> ps
         PID TTY      TIME COMD
       16558 ttyq3    9:37 viewer
       11289 ttyq3    0:01 tcsh
```

```
  16581 ttyq3    0:00 viewer
  16902 ttyq3    0:00 ps

unix>> kill -9 16558 16581

unix>> ps
    PID TTY      TIME COMD
 11289 ttyq3    0:01 tcsh
 16904 ttyq3    0:00 ps
```

//--//

Removing the entire distribution:

Be sure to move any files that you want to save to different directories.

You do not have to remove the old distribution prior to updating to a new version. However you might want to, so that superceded files in old distributions are not left over.

To remove everything, run the shell script auv-uvw.virtual-world.REMOVE:

```
unix> source   auv-uvw.virtual-world.REMOVE
```

//--//

Future work (lots!)

Porting the OpenInventor viewer code to other architectures and porting other virtual world components to other architectures depends on availability of OpenInventor and multicast TCP/IP support. Porting is planned for 1995.

Other people are always welcome to use and extend this code. Please keep me informed of your efforts if you find it of value.

Other research collaborations to extend the underwater virtual world to build up a truly large-scale Internet-wide fully distributed virtual world are of particular interest.

Integrate Dr. Larry Ziomek's Recursive Ray Acoustics (RRA) sonar model.

Incorporate pre-processed terrain datasets for Monterey Bay.

Virtual Reality Modeling Language (VRML) - see the working group http://www.wired.com/vrml/

Dissertation "A Virtual World for an Autonomous Underwater Vehicle" is being written and will be made publicly available.

C. *mission.output.email* Mission Output Electronic Mail Report

The following report is sent by electronic mail to users who execute a robot mission. It demonstrates that robots, once networked, can report back results only when they are of interest or human intervention is specifically desired. The goal is for the robot to meet user directives conveniently, rather than requiring constant monitoring or supervision.

The mission report combines an NPS AUV reference information file, the mission script that drove the robot, and the resulting time line of propulsor and plane surface orders. It is also available by querying the robot account with the Unix "finger" command: *finger auv@cs.dude.nps.navy.mil*

```
                        NPS AUV Mission Report

Here is a mission report generated by the Naval Postgraduate School (NPS)
Autonomous Underwater Vehicle (AUV) running in an Underwater Virtual World.

This message was created by the operating robot connected to the network.
Actual robots with network connections can send reports such as this
to research teams and interested individuals when scientific discoveries
are made or unusual circumstances occur.

This project is part of a PhD dissertation. Here is the abstract:

A Virtual World for an Autonomous Underwater Vehicle

Don Brutzman
Code OR/Br, Naval Postgraduate School
Monterey California 93943-5000 USA
(408) 656-2149 office, (408) 656-2595 fax
brutzman@nps.navy.mil

A critical bottleneck exists in Autonomous Underwater Vehicle (AUV) design and development. It is tremendously difficult to observe, communicate with and test underwater robots, because they operate in a remote and hazardous environment where physical dynamics and sensing modalities are counterintuitive.

An underwater virtual world can comprehensively model all salient functional characteristics of the real world in real time. This virtual world is designed from the perspective of the robot, enabling realistic AUV evaluation and testing in the laboratory. 3D real-time graphics are our window into that virtual world. Visualization of robot interactions within a virtual world permits sophisticated analyses of robot performance that are otherwise unavailable. Sonar visualization permits researchers to accurately "look over the robot's shoulder" or even "see through the robot's eyes" to intuitively understand sensor-environment interactions.

Distribution of underwater virtual world components enables scalability and real-time response. The IEEE Distributed Interactive Simulation (DIS) protocol is used for compatible live interaction with other virtual worlds. Network access allows individuals remote access. This is demonstrated via MBONE collaboration with others outside The Edge, and Mosaic access to pertinent archived images, papers, datasets, software, sound clips, text and any other computer-storable media.

This project presents the frontier of 3D real-time graphics for underwater robotics, ocean exploration, sonar visualization and worldwide scientific collaboration.

III. NPS AUTONOMOUS UNDERWATER VEHICLE EXECUTION LEVEL

A. Introduction

The execution level of robot software is the hard real-time process which controls propellers, thrusters, plane surfaces, sonars and other sensors. Hardware interfaces to the robot microprocessor are controlled by the execution level. The execution level is further tasked with interprocess communications with the tactical and strategic levels of the robot architecture (Byrnes 93), as well as the virtual world when operating in the laboratory.

The execution code presented here has been tested under a wide variety of laboratory conditions. Regrettably much of the interface code to actual vehicle hardware has not been tested since early 1994 when a battery explosion caused major damage to the NPS AUV II. Hardware repairs from February through October 1994 were required before in-water testing resumed. Nevertheless pre-explosion hardware interface source code has been retained in place and clearly identified through comments and compile flags. Future work includes verifying hardware interface code (Marco 95), updating the execution code and then running the combined virtual world/real world version of the execution level in the water.

An important benefit of a robot connected to an integrated simulator (Brutzman 92a, 92b, 92c) or underwater virtual world (Brutzman 94) is that robot software development can continue independently of actual robot readiness. Approximately half of the execution level source code presented here was developed during the eight month period that the NPS AUV II was out of commission. This advantage alone proved to be strong justification for the value of providing a network connection to the actual robot microprocessor and software. The essential requirement for integrated simulation in an underwater robotics research and development program has been subsequently confirmed by other researchers (Trimble 94) (Kuroda 94).

Another important strength of the robot software is that the Kernigan and Richie

variant ***C*** language source code is able to compile correctly under two dissimilar operating systems: SGI Irix 5.2, a Unix variant, and OS-9 version 2.3, a real-time operating system that includes features similar to both Unix and DOS. Compiler directives, customized makefiles and command line aliases are used to provide this cross-platform portability. Network communication via sockets has also been made compatible between these two operating systems. This flexibility has been invaluable for rapid and effective software development. One example out of many is that diagnosis and debugging tools under Unix are far more robust than under OS-9, permitting detection and correction of subtle difficulties not detectable by the OS-9 ***C*** language compiler and linker.

Future work includes upgrading execution and tactical level communication links. Currently communications between levels use serial and parallel ports, a highly customized and error-prone hardware arrangement. By adding Ethernet connectivity to the tactical level computer, all software levels will be able to communicate via sockets regardless of what networked processor or workstation they might physically reside on. Additional long term goals include extending Internet protocol compatibility to acoustic telemetry communications. Ultimately underwater robots will be independent nodes on the Internet regardless of whether they are in the laboratory, operating with a tether or swimming freely and autonomously within an acoustic local area network (ALAN). The sophistication of virtual worlds will grow closer to that of the real world as robots and researchers operate in each.

B. *mission.script.HELP* Robot Execution Level Mission Script Syntax

```
//------------------------------------------------------------------------//

        ~/execution/mission.script.HELP                11 October 94

        Mission script syntax for NPS AUV execution level control in

                              the NPS AUV  Underwater  Virtual World

        Don Brutzman                              brutzman@nps.navy.mil

//------------------------------------------------------------------------//

This file describes how to change and create NPS AUV mission script files.
Files and the 'execution' program are in the ~/execution subdirectory.

        To run a new mission, copy an existing mission file over file
         'mission.script' or edit the mission.script file for a new mission.

        Example:        unix> cd execution
                        unix> cp  mission.script.siggraph  mission.script
                        unix> execution  remotehost fletch.cs.nps.navy.mil

Script commands are read by AUV execution level (execution.c)
        from the "mission.script" default file at the start of each mission.

Some of the following commands will also work when invoked from the command
        line upon execution.

Here are script keywords (and synonyms) that are currently recognized:

          |            |
----------+------------+-------------------------------------------------------
Keywords | Parameters |  Description
Synonyms | [optional] |  (units in feet or degrees as appropriate)
---------+------------+-------------------------------------------------------
         |            |
HELP                    Provide a list of available keywords
?                       (as specified in this HELP file).
/?
-?

REMOTEHOST  hostname    tells execution level to open socket to virtual world
REMOTE      hostname    which is already executed and waiting on 'hostname'
                        REMOTEHOST is a command line switch.  Example:
                        unix> execution  remotehost fletch.cs.nps.navy.mil

//                      comments follow on this line which are not executed
/*                      note comments will still be spoken if AUDIO-ON
#                       pound sign also indicates a comment if in first column

WAIT                    #       Wait (or run) for # seconds (letting the robot
execute)
RUN             #       prior to reading from the script file again

TIME            #       Wait (or run) until robot clock time #
WAITUNTIL       #       (letting the robot execute its current orders)
PAUSEUNTIL      #       prior to reading from the script file again

TIMESTEP        #       change default execution level time step interval
TIME-STEP       #       from default of 0.1 sec to # sec

PAUSE                   temporarily stop execution until <enter> is pressed
```

```
REALTIME                run execution level code in real-time
REAL-TIME               (busy wait at the end of each timestep if time remains)

NOREALTIME              run execution level code as quickly as possible
NO-REALTIME
NONREALTIME
NOWAIT
NO-WAIT
NOPAUSE
NO-PAUSE

MISSION filename        Replace 'mission.script' with 'filename' and start
SCRIPT  filename        the new mission
FILE    filename

KEYBOARD                read script commands from keyboard
KEYBOARD-ON

KEYBOARD-OFF            read script commands from mission.script file
NO-KEYBOARD

QUIT                    do not execute any more commands in this script, but
STOP                    repeat the mission again if LOOP-FOREVER is set
DONE
EXIT
REPEAT
RESTART
COMPLETE
<eof> marker

KILL                    same as QUIT but also shuts down socket to virtual world
SHUTDOWN                'dynamics' process.

RPM             # [##]  Set ordered rpm values to # for both propellers
SPEED           # [##]  [ or independently set left & right rpm values
PROPS           # [##]    to # and ## respectively]
PROPELLORS      # [##]  maximum propellor speed is +- 700 rpm => 2 ft/sec

DEPTH           #       Set new ordered depth (commanded z)

PLANES          #       Force planes to remain at # degrees

DEADSTICKPLANES [#]     Force planes to remain at 0 [or #] degrees

THRUSTERS-ON            Enable vertical and lateral thruster control
THRUSTERS
THRUSTERON
THRUSTERSON

NOTHRUSTER              Disable vertical and lateral thruster control
NOTHRUSTERS
THRUSTERS-OFF
THRUSTERSOFF

ROTATE          #       open loop lateral thruster rotation control
                        at # degrees/sec
```

```
NOROTATE                disable open loop lateral thruster rotation control
ROTATEOFF
ROTATE-OFF

LATERAL                 #       open loop lateral thruster translation control
                        at # ft/sec
                        (positive is to starboard, maximum is 0.5 ft/sec)

NOLATERAL               disable open loop lateral thruster translation control
LATERALOFF
LATERAL-OFF

POSITION     # ## ###   reset vehicle dead reckon position to
LOCATION     # ## ###   (x, y, z) = (#, ##, ###)

ORIENTATION  # ## ###   reset vehicle orientation to
ROTATION     # ## ###   (phi, theta, psi) = (#, ##, ###)

CONTINUE                continue reading script & executing, no action performed
GO

STEP                    loop for another timestep prior to reading script again.
SINGLE-STEP             Particularly useful in keyboard mode.

TRACE                   enable  verbose print statements in execution level
TRACE-ON

TRACEOFF                disable verbose print statements in execution level
TRACE-OFF
NOTRACE
NO-TRACE

LOOPFOREVER             repeat current mission when done.
LOOP-FOREVER            each repetition is called a 'replication.'

LOOPONCE                do not LOOPFOREVER, stop when end of script is reached
LOOP-ONCE

LOOPFILEBACKUP          back up output files during each loop replication
LOOP-FILE-BACKUP        to permit inspection while new files are written
                        the backup files are in execution directory:
                        output.telemetry.previous & output.1_second.previous

ENTERCONTROLCONSTANTS   start a keyboard dialog to enter
ENTER-CONTROL-CONSTANTS revised control algorithm coefficients

SLIDINGMODECOURSE       Sliding mode course control algorithm (not yet working)
SLIDING-MODE-COURSE

SLIDINGMODEOFF          Disable sliding mode course control algorithm
SLIDING-MODE-OFF

SONARTRACE              enable  verbose print statements in execution sonar code

SONARTRACEOFF           disable verbose print statements in execution sonar code

SONARINSTALLED          sonar interface hardware cards are installed, use them

PARALLELPORTTRACE       enable trace statements for parallel port communications

AUDIBLE                 enable  text-to-speech audio output
AUDIO
AUDIO-ON
SOUND-ON
SOUNDON
SOUND
```

22

```
SILENT                  disable text-to-speech audio output
SILENCE
NOSOUND
SOUNDOFF
SOUND-OFF
AUDIOOFF
AUDIO-OFF
QUIET

EMAIL                   ask  user for electronic mail address at mission start,
EMAIL-ON                send user an  electronic mail report  at mission finish
E-MAIL
E-MAIL-ON
EMAILON

EMAILOFF                disable electronic mail address query feature
EMAIL-OFF
E-MAILOFF
E-MAIL-OFF
NO-E-MAIL
NO-EMAIL
NO-E-MAIL
NOEMAIL

WAYPOINT    #X #Y [#Z]  Point towards waypoint with coordinates (#X, #Y)
WAYPOINT-ON #X #Y [#Z]  (depth #Z optional).  Leave waypoint control by
                        ordering course, rudder, sliding-mode, rotate or
                        lateral thruster control.

WAYPOINTFOLLOW          Set mode to arrive at each waypoint before reading the
WAYPOINT-FOLLOW         next mission script command, i.e. continue towards each
                        waypoint for however long it takes to reach the standoff
                        distance before pausing to read the next command.

WAYPOINTFOLLOWOFF       Disables WAYPOINTFOLLOW mode
WAYPOINT-FOLLOW-OFF

STANDOFF           #    Change standoff distance for WAYPOINT-FOLLOW and HOVER
STAND-OFF          #    control
STANDOFFDISTANCE   #
STANDOFF-DISTANCE  #
STAND-OFF-DISTANCE #

HOVER      [#X #Y [#Z]] Hover using thrusters and propellers for longitudinal
                        and lateral positioning at specified or previous
                        waypoint

HOVER       #X #Y  #Z   [#orientation]  [#standoff-distance]

                        Uses WAYPOINT control until within #standoff-distance
                        of HOVER point (#X, #Y, #Z), then switches to
                        HOVER control with [optional] final #orientation

                        Full speed (700 RPM) port & starboard is used if
                        AUV distance to WAYPOINT is > #standoff-distance + 10',
                        then slows to 200 RPM until within #standoff-distance,
                        then HOVER control.
```

23

C. *execution.c* Robot Execution Level Real-Time Control Program

```
/*************************************************************************/
/*
 Program:          execution.c  AUV execution level program

 Authors:          Don Brutzman, Dave Marco & Walt Landaker

 Revised:          28 October 94

 System:           AUV Gespac 68020/68030, OS-9 version 2.4
 Compiler:         Gespac cc Kernighan & Richie (K&R) C

 Compilation:      ftp>     put execution.c
                   auvsim1> chd execution
     [68020]       auvsim1> make -k2f execution
     [68030]       auvsim1> make      execution

     [Irix ]       fletch>  make execution

 Execution:
     [Irix ]       fletch> cd execution
                   fletch>    execution  remote dynamics-hostname

                   where dynamics-hostname is the IP name of the host running
                   the dynamics (virtual world) program

 Plotting:         see gnuplot scripts 'auv_plot.gnu' and 'auv_plot_1_second.gnu'
                   fletch> gnuplot  auv_plot.gnu

 Debugging:        gravy1:~brutzman/execution>> lint -lm execution.c

                   lint -lm -Iglobals.h -Idefines.h globals.c parse_functions.c \
                         execution.c

                   fletch>  make warnings

 Description:      closed loop for operation during vehicle in-water
                              missions as well as in virtual world

 Active changes:   Don Brutzman    working lab/virtual world networked version
                                 & tactical level interface

                   Dave Marco      working vehicle code
                                 & interfacing physical devices

 Future work:      Update digital <==> analog access for new vehicle hardware

                   Retest code after vehicle repaired

                   Sonar/altimeter integration code reintegrated/retested

                   Audio strings seem to be generated differently by OS-9

                   standardize parsing of command line and script commands

                   finish sliding mode control

                   change serial/parallel comms to sockets once
                       tactical level gets an Ethernet card

 Testing interprocessor connections:
```

24

```
   parallel port   /P          OS-9 auvsim1> mfi_a3

                   LPT1:       DOS  auvsim2> portfix
                                           > print filename.txt

     serial port   (/T1) /TT   OS-9 auvsim1> wr2t1           then write text
                               OS-9 auvsim1> rdt1a           then read  text
                               DOS  auvsim2> C:\COMM\PROCOMM
                                                  then <alto> for chat mode
                                                 <altF10> help, <altX> exit
 Interfaces:

    Telemetry sent         via serial   port /tt [== /t1 at high baud rate]
    Telemetry received     via parallel port /P

    Telemetry is optionally passed to/from tactical level running on 80386

    Reads files:           mission.init  [mission initialization data file   ]
    Writes files:          output.data   [vehicle telemetry state vector data]
                           output.auv    [tactical order/executive report log]

    Sonar commands/replies via device port /t3

    Note that %F double formats are used instead of %lf on scanf() and sscanf()
              calls for OS-9 compatibility

/*
The program code for the Multi-Function Interface originated from 'mfi.c'
Routines include Init_PortA, Init_PortB, Read_PortA, Read_PortB, Read_PortAB

Excerpt of 'mfi.c' comments follows:

  Program example for the Multi-Function-Interface (MFI)
  This example uses the 6821 PIA on the MFI board
  General purpose functions are provided to initialize the PIA
  and read/write data to the ports

  MFI P2 connector definitions are provided by the GESMFI-1 data
  sheet available from GESPAC, Inc.

  6821 device specifics are covered in the 8-bit microprocessor
  & peripheral data book from Motorola Inc.

  3/1/91        J. Rawlins      RealTime Software Consulting

```
/*****************************************************************************/
/*
 Program:         parse_functions.c

 Authors:         Don Brutzman

 Revised:         28 October 94

 System:          AUV Gespac 68020/68030, OS-9 version 2.4
 Compiler:        Gespac cc Kernighan & Richie (K&R) C

 Compilation:     ftp>     put parse_functions.c
                  auvsim1> chd execution
     [68020]      auvsim1> make -k2f execution
     [68030]      auvsim1> make      execution

     [Irix ]      fletch>  make execution

 Purpose:         Reduce size of execution.c to allow OS-9 C compiler to work

*/

 Program:         globals.c

 Authors:         Don Brutzman

 Revised:         21 October 94

 System:          AUV Gespac 68020/68030, OS-9 version 2.4
 Compiler:        Gespac cc Kernighan & Richie (K&R) C

 Compilation:     ftp>     put globals.c
                  auvsim1> chd execution
     [68020]      auvsim1> make -k2f execution
     [68030]      auvsim1> make      execution

     [Irix ]      fletch>  make execution

 Purpose:         Allows repeated use of global variables global.c via global.h
                  in order to prevent compiler warnings

F. *globals.h* Global Variable Define File to Permit Multiple References

```
/*****************************************************************************/
/*
 Program:         globals.h

 Authors:         Don Brutzman

 Revised:         28 October 94

 System:          AUV Gespac 68020/68030, OS-9 version 2.4
 Compiler:        Gespac cc Kernighan & Richie (K&R) C

 Compilation:     ftp>     put globals.h
                  auvsim1> chd execution
     [68020]      auvsim1> make -k2f execution
     [68030]      auvsim1> make      execution

     [Irix ]      fletch>  make execution

 Purpose:         Allows repeated use of global variables global.c via global.h
                  in order to prevent compiler warnings

*/

IV. UNDERWATER VIRTUAL WORLD GRAPHICS

A. Introduction

The Open Inventor 2.0 applications program interface (API) is used for generating 3D computer graphics images representing the virtual world (Wernecke 94a, 94b). Open Inventor was chosen for the virtual world graphics engine due to its being built upon the Open GL graphics language, expected portability to multiple hardware architectures and operating systems, SGI-standard scene description language, object-oriented design, broad flexibility and strong support. The Open Inventor scene description language (*.iv*) is likely to become a compatible standard with numerous graphics engines and the nascent Virtual Reality Modeling Language (*.vrml*), a research extension to Hypertext Markup Language (*.html*).

Embedded in the graphics viewer code is a Distributed Interactive Simulation (DIS) 2.0.3 multicast network API which permits *viewer* to receive robot update information nearly anywhere the Internet via the Multicast Backbone (MBone). After the configuration file *.sd.tcl* is installed, the *viewer* program can be launched automatically via the MBone session directory (*sd*) advertisement application, enabling simple remote *viewer* execution and connection to an already-running virtual world. Future work includes adding a WWW-compatible scene and object loader, and the capability to receive URLs for retrieval, either via DIS updates or from objects encountered by the robot that are already in the scene graph.

B. *viewer.C* Object-Oriented Real-Time 3D Computer Graphics Viewing Program using Open Inventor 2.0

```
//////////////////////////////////////////////////////////////////////////
/*
 Program:        viewer.C

 Description:    Open Inventor viewer for
                 NPS AUV Underwater Virtual World

 Author:         Don Brutzman

 Revised:        28 October 94

 System:         Irix 5.2

 Compiler:       ANSI C++ / Open Inventor API

 Compilation:    irix> make viewer

 References: (1) IEEE Protocols for Distributed Interactive Simulation (DIS)
                 Applications version 2.0, Institute for Simulation and
                 Training, Universit of Central Florida, Orlando Florida,
                 28 May 1993.

                 _The Inventor Mentor_, Addison-Wesley, Reading Massachusetts,
                 1994.

 Advisors:       Dr. Mike Zyda, Dr. Bob McGhee and Dr. Tony Healey

 Notes:          Underwater virtual world is in feet, standard DIS PDU is meters

                 Inventor 1.0.1 and DIS libraries were NOT compatible due to
                 programs hangups which are triggered by mallocs in the
                 DIS libraries conflicting with the Inventor window.
                 Removing DIS libraries and just putting malloc's in the
                 Inventor screen redraw callback function caused identical
                 program hangups.  No fix was found.  Upgrading to OpenInventor
                 under Irix 5.2 eliminated this problem completely.

 Future work:    Automated camera control

                 .iv file load via WWW URLs

                 optimization

V. UNDERWATER VIRTUAL WORLD HYDRODYNAMICS

A. Introduction

Structuring the model design problem was the key to comprehensible implementation. A straightforward hierarchy follows. Posture is common to all vehicles and can be represented either by Euler angle rotations, by a homogenous transformation matrix (Fu 87) (Foley, van Dam 90), or by quaternions (Cooke 92). Forces and accelerations acting upon a rigid body, if modeled, are related by dynamics equations of motion corresponding to each spatial degree of freedom. A rigid body is further subject to kinematics equations of motion which combine velocities with postures in strictly defined ways regardless of vehicle type or environmental dimensionality. A networked rigid body which communicates with other entities via DIS needs to calculate postures, optional linear and rotational velocities, and (again optional) linear accelerations (IEEE 93). Such a DIS-networked rigid body has identical capabilities regardless of vehicle type.

An entity dynamics component for a real-time networked virtual world combines the functionality of rigid bodies and DIS networking with the dynamics equations of motion (forces and accelerations) unique to a specific vehicle type. This structured hierarchy of relationships between posture representations, rigid bodies, DIS networking and dynamics equations of motion led to the general model class diagram which appears in Figure 1.

The compartment boxes within Figure 1 delineate the functionality of class components. The first compartment is class name. The second compartment indicates member data fields, which are the data structures encapsulated by the object. The third compartment indicates object methods (functions) which effectively occur instantaneously. The fourth compartment includes methods (functions) which are time-consuming, either from the perspective of simulation clock duration or actual delay due to network latency. Adapted from the Object-Oriented Simulation Pictures

(OOSPICs) design and testing methodology (Bailey 94), this diagraming approach is very useful because it simplifies presentation of key object relationships and clarifies hierarchy design. Of particularly value is the explicit specification of temporal relationships, which are critical to success in a real-time system and are often overlooked in complex system design. An example object template which adapts the OOSPICs methodology from ***MODSIM*** programming language to ***C++*** appears as Figure 2. A key for OOSPIC arrow conventions is included in Figure 3 (Bailey 94). Although ***C++*** OOSPICs are not provided for each class, inspection of specifications in the accompanying source code reveals that every class follows the structural layout presented in Figure 1.

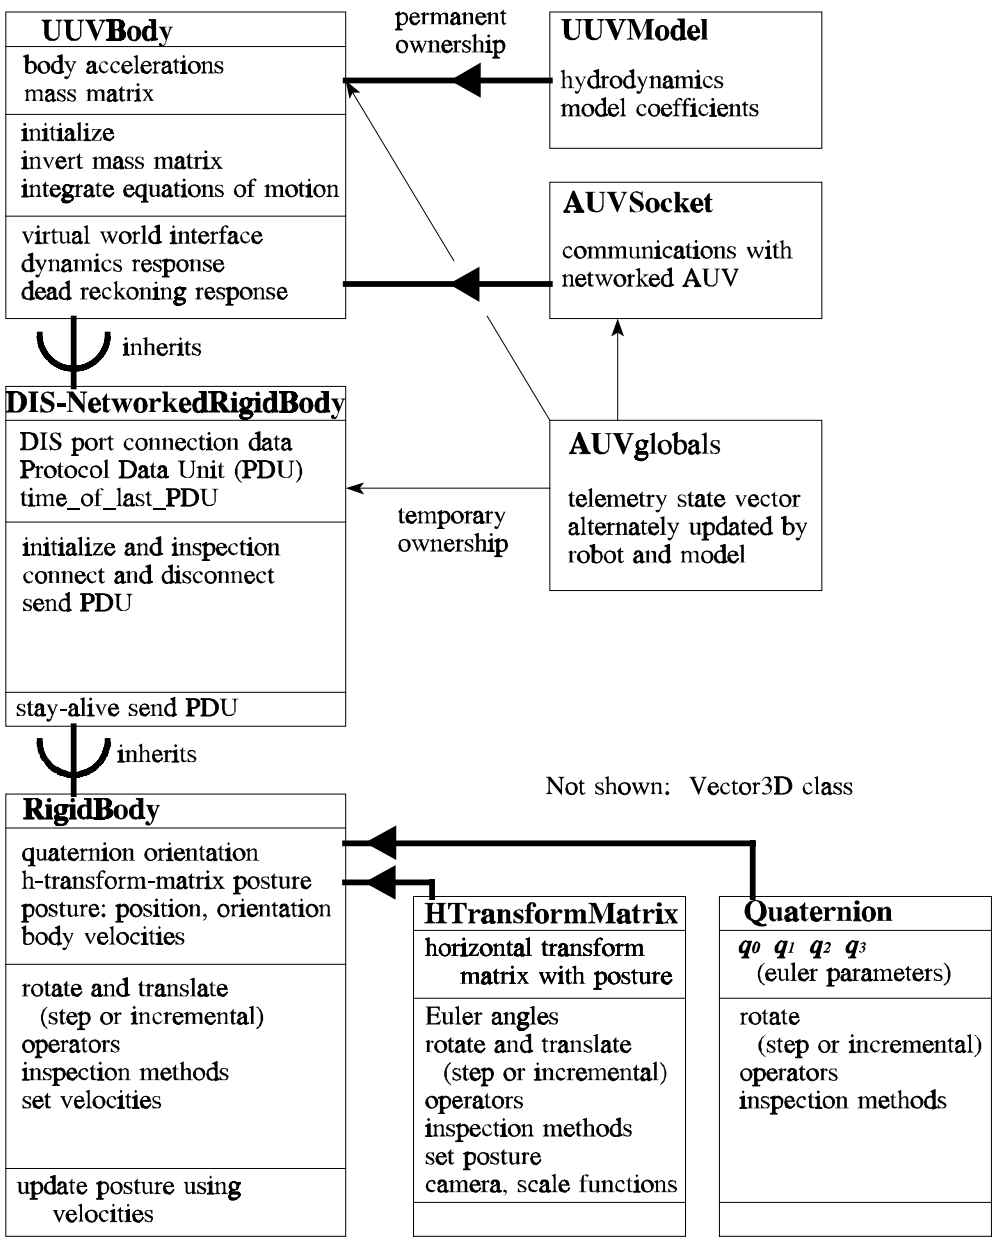

Figure 2. General real-time DIS-networked hydrodynamics model class hierarchy.

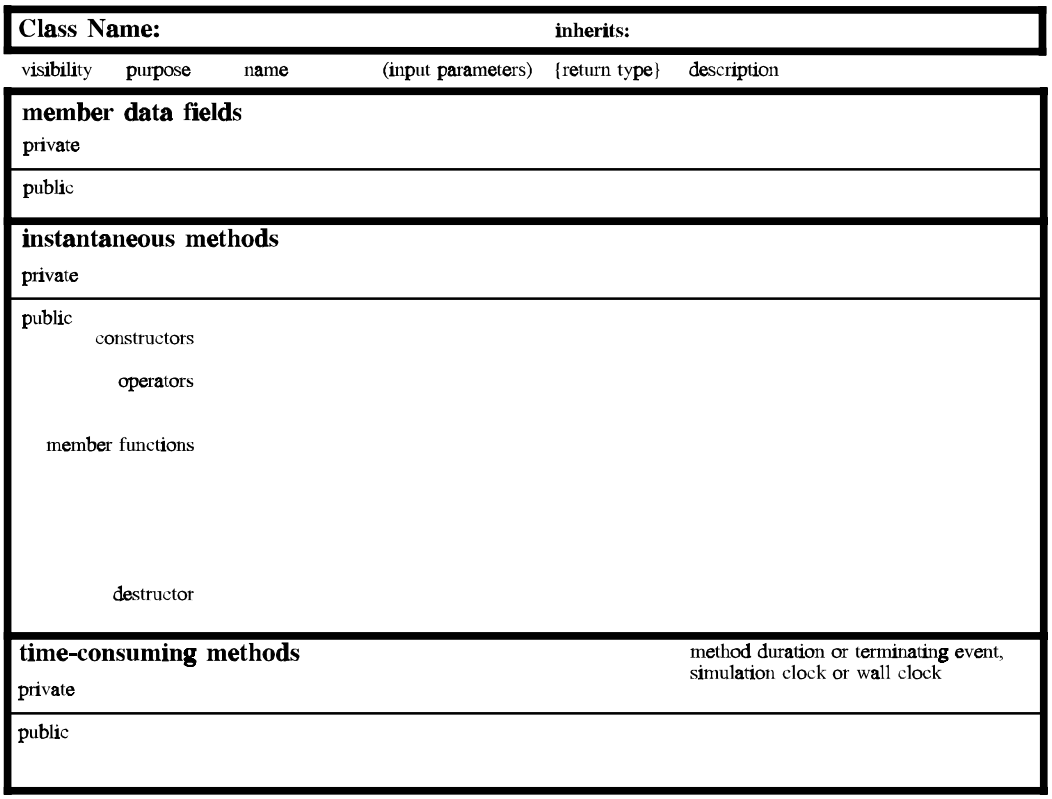

Figure 3. OOSPIC class diagram template for ***C++*** class definitions. Separation of class name, data fields, instantaneous methods and temporal methods clarifies class functionality and design.

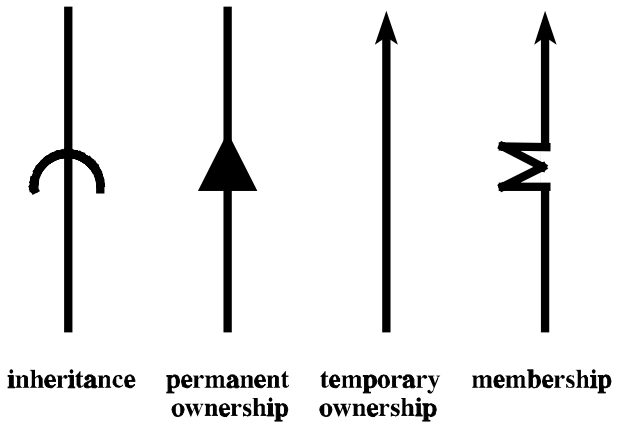

Figure 4. Object-Oriented Simulation Pictures (OOSPICs) arrow conventions.

The structure of the general real-time DIS-networked dynamics model presented here appears to be applicable to vehicles of arbitrary type. Documented source code for each member of the class hierarchy matches the equations and algorithms presented in this work, and also follows the structure appearing in Figure 2 (Brutzman 94). Future work of interest in model design includes directly porting this model to emulate the characteristics of other underwater vehicles, adapting the model to accommodate dissimilar vehicle entities, porting the model into robot software as an on-board hydrodynamics response predictor, and investigating extensions to the model to support visualization, validation and verification of model relationships against archived or live data records of actual vehicle dynamics performance.

B. *dynamics.C* Virtual World Interface and Top-Level Hydrodynamics

The *dynamics* program is the server connection to the underwater virtual world. It must be started prior to the robot *execution* program so that the robot has a virtual world to connect to. *dynamics* also provides a user interface for setting ocean currents, multicast network parameters and hydrodynamics class library test routines. The user menu appears in Figure 4.

The *dynamics* program has a text-only user interface in order to reduce processor loading, maximize portability and facilitate remote operation. The menu option to reset multicast group parameters permits starting a virtual world channel using collision-free parameters automatically chosen by the MBone *sd* session directory application. The menu option for ocean currents accepts a constant 3D vector. Extending the overall functionality of the underwater virtual world is accomplished by building hooks between new models (such as time-varying ocean currents) and the *dynamics* program. New models can either be embedded directly within *dynamics*, or can be distributed and communicate via sockets.

 Program:         dynamics.C

 Description:     hydrodynamics model and virtual world manager

 Author:          Don Brutzman

 Revised:         18 October 94

 System:          Irix 5.2

 Compiler:        ANSI C++

 Compilation:     irix> CC   dynamics.C -lm -w -g -o dynamics

            [or] unix> make dynamics

                   +w == Warn about all questionable constructs.

 Advisors:        Dr. Mike Zyda, Dr. Bob McGhee and Dr. Tony Healey

 Lessons:         Need single char input without requiring <CR>

                  Don't use 'static' for member data fields or mysterious linker
                      eRrors result
```

```
                Don't use << endl << endl more than once in a single cout call
                     or a vague warning results with an invalid line number:
                    'warning:  ostream&ostream::operator <<(ostream&(*)
                     (ostream&)) not inlined, called twice in an expression'

*/

E. *UUVBody.C* Unmanned Underwater Vehicle Networked Rigid Body

```
//////////////////////////////////////////////////////////////////////////
/*
 Program:           UUVBody.C

 Description:       Six degree-of-freedom underwater vehicle hydrodynamics
                    based on Healey model

 Revised:           28 October 94

 System:            Irix 5.2

 Compiler:          ANSI C++

 Compilation:       irix> make dynamics
                    irix> CC UUVBody.C -lm -c -g +w

                    -c == Produce binaries only, suppressing the link phase.
                    +w == Warn about all questionable constructs.

 Advisors:          Dr. Mike Zyda, Dr. Bob McGhee and Dr. Tony Healey

 Author:            Don Brutzman                    brutzman@cs.nps.navy.mil

 Status:            Equations of motion tested satisfactorily,
                    verification against in-water tests remains.
                    Move utilities to math_utilities.c

 Future work:       Comments and suggestions are welcome!

F. *AUVsocket.C* Communications with a Networked AUV

```
/*****************************************************************************
 Program:           AUVsocket.C

 Description:       socket from auv execution level to Irix auv virtual world
                    receives partial telemetry, returns full telemetry with
                         dynamics parameters added

                    AUVsocket.C is a function library used by UUVBody

                    AUVsocket also provides voice server interface

 Revised:           28 October 94

 Compilation:       unix> make AUVsocket

 Original bases:    os9server.c, dynamics.c

 References:    (1) (Gespac-provided) EVIRA EVLAN-11 Ethernet Data Link
                    Controller for the G64/G96 Bus/EVTCP Internet Package

                (6) Real-Time Programming Tutorial, Bill Mannel, SGI Expo,
                    Silicon Graphics Inc., 23 May 93
                (7) "Say..."  Axel Belinfante's speech server at University
                    of Twente, Netherlands, which also uses Nick Ing-Simmons'
                    phoneme synthesizer 'rsynth':
                    http://utis179.cs.utwente.nl:8001/say/?

 Status:            Tested satisfactorily

 Future work:       Consider implementation as an inetd 'superserver' daemon or
                        just closing socket when done, reopening & waiting

                    Consider bounds diagnostic checking on values transferred
                        over socket

                    Fix type mismatch on signal () calls - very gnarly problem!

                    Comments and suggestions are welcome!

                   -c == Produce binaries only, suppressing the link phase.
                   +w == Warn about all questionable constructs.

 Description:     Rigid body class specification.
                  Note: world coordinate system, NOT body coordinate system,
                        thus Euler angles are used.

I. *Hmatrix.C* Homogeneous Transform Matrix Mathematics

```
////////////////////////////////////////////////////////////////////////////
/*
 Program:         Hmatrix.C

 Author:          Don Brutzman

 Revised:         12 October 94

 System:          Iris

 Compiler:        ANSI C++

 Compilation:     irix> make dynatest
                  irix> CC Hmatrix.C -lm -c -g +w

                   -c == Produce binaries only, suppressing the link phase.
                   +w == Warn about all questionable constructs.

 Description:     Homogenous transform matrix class specification
                  All angle parameter values are in radians

                  rotations    are in world coordinate system
                  translations are in world coordinate system

 Advisors:        Dr. Mike Zyda, Dr. Bob McGhee and Dr. Tony Healey

 Program:         Quaternion.C

 Revisions:       Don Brutzman

 Revised:         29 SEP 94

 System:          Irix

 Compiler:        ANSI C++

 Compilation:     irix> make dynatest
                  irix> CC Quaternion.C -lm -c -g +w

                   -c == Produce binaries only, suppressing the link phase.
                   +w == Warn about all questionable constructs.

 Description:     Quaternion class specifications and implementation
                  All angle parameter values are in radians.

 Advisors:        Dr. Mike Zyda, Dr. Bob McGhee and Dr. Tony Healey

 References:      Haynes, Keith, "Computer Graphics Tools for the
                  Visualization of Spacecraft Dynamics," masters thesis,
                  Naval Postgraduate School, December 1993.  Includes
                  source code used for initial version of quaternion.c

VII. NETWORKING

A. Introduction

The principal networking code used in the underwater virtual world has already been presented in previous listings. Source programs *execution.c* and *AUVsocket.c* implement socket communications between robot and virtual world, while *DISNetworkedRigidBody.C* and *viewer.C* communicate via DIS PDUs over the MBone. These communications links were not created from scratch. The following test programs were used in program development and are included as valid standalone applications that can be used to test network software, independently of the robot or computer graphics applications.

os9sender.c and *os9server.c* are a client/server pair used to open test and close a point-to-point socket. What is unusual about these programs is that they were developed to operate interchangeably on either Unix systems using Berkeley Software Distribution (BSD) 4.3 network routines, or on OS-9 processors using Microware-provided network routines (Microware 91a, 91b). Network code is difficult to debug so extensive trace options are provided to assist in diagnosing difficulties.

Prior to the current multicast version (2.0.3) of the DIS library distribution, all DIS interfaces used broadcast or unicast transport protocols. This meant that all network interactions between DIS applications were restricted to a single local area network (LAN). Such a limitation is unacceptable if an underwater virtual world is to be capable of communicating globally across the Internet. *disbridge.c* was written to create a socket bridge between LANs which reflected DIS PDUs identically in either direction. Multiple *disbridge* programs could connect arbitrary numbers of LANs with only a single *disbridge* needed for each new network addition. Although such an approach is inconvenient and a somewhat inefficient use of bandwidth, it can extend the broadcast/unicast DIS approach to large numbers of networks.

disbridge has been tested successfully with earlier versions of the underwater

virtual world, and also with the NPS Platform Foundation (Bailey 94). Fortunately *disbridge* is no longer needed since the newer multicast DIS version 2.0.3 can take advantage of the MBone to attain Internet-wide connectivity (Zeswitz 93). Nevertheless only about a thousand subnets are currently connected to the MBone, and conceivably *disbridge* might someday be useful to connect networks independently of the MBone. Recommended future work includes upgrading *disbridge* to be compatible with future versions of the DIS library in unicast, broadcast or multicast modes.

B. *os9sender.c* Unix to OS-9 Socket Communications Client

```
/*****************************************************************************
 Program:           os9sender.c

 Description:       socket test program to pass input strings in 2 directions,
                       especially socket from OS-9 auvsim1 to Irix fletch.cs

 Revised:           31 MAY 94

 Compilation:       unix> cc os9sender.c -o os9sender
                    os-9> make os9sender

 Execution:         host1>   os9server
                    host2>   os9sender -r host1

 Example:           fletch>  os9server
                    auvsim1> os9sender -r fletch

 Execution options:

          -r -h -t  (first letters are sufficient, capital letters are OK too)

  -remote hostname  hostname.remote.net.address for client to connect to server
                    no default is present

             -help  display calling syntax

            -trace  turn on TRACE mode

C. *os9server.c* Unix to OS-9 Socket Communications Server

```
/*****************************************************************************
 Program:           os9server.c

 Description:       socket test program to pass input strings in 2 directions,
                       especially socket from OS-9 auvsim1 to Irix auvsim4

 Revised:           20 JAN 94

 Compilation:       unix> cc os9server.c -o os9server
                    os-9> make os9server

 Execution:         host1>   os9server
                    host2>   os9sender -r host1

 Example:           fletch>  os9server
                    auvsim1> os9sender -r fletch

 Execution options:

             -h -t  (first letters are sufficient, capital letters are OK too)

             -help  display calling syntax

            -trace  turn on TRACE mode

 Author:            Don Brutzman                    brutzman@cs.nps.navy.mil
                    Code OR/Br
                    Naval Postgraduate School       (408) 656-2149 work
                    Monterey CA 93943-5000          (408) 656-2595 fax

 Status:            Tested satisfactory Irix<==>Irix, OS-9<==>OS-9, Irix<==>OS-9

 Future work:       Consider implementation as an inetd 'superserver' daemon.

                    Ensure compatibility with DIS v2.0 protocols when available.

                    Comments, suggestions and corrections are welcome!

```

D. *disbridge.c* LAN to LAN Connectivity for DIS without Multicast

```
/*****************************************************************************
 Program:           disbridge.c

 Description:       Relays DIS packets between LANs on different Internet hosts

 Revised:           7 July 93   DIS version 1.3

 Compilation:       % DIS-1.3/src>> make bridge

 Execution:         % host1>> disbridge -server

                    % host2>> disbridge [-client] -remote host1.internet.address

 Execution options:

 -s -c -r -H -I -t  (first letters are sufficient, capital letters are OK too)

           -server  server mode; must be running prior to client calling for it

         [-client]  client mode [default]; remote host must be specified and
                    have disbridge -server already running there

  -remote hostname  hostname.remote.net.address for client to connect to server

             -help  display calling syntax

    -interface et0  will force use of a given device interface (e.g. "et0") for
                    multicast packet listening on the local net.  disbridge will
                    attempt to open the first known device if the default device
                    fails.  Only one parent process is allowed to use that
                    device on a given machine.  Thus if you want to connect one
                    local area network (LAN) with another, each LAN must
                    dedicate one machine to disbridge.  This appears to be an
                    unavoidable hardware/multicast restriction.

            -trace  turn on TRACE mode

                    Monterey CA 93943-5000          (408) 656-2595 fax

 Acknowledgement:   Thanks to John Locke, Mike Macedonia & Dave Pratt for
assistance.

 Status:            Tested satisfactorily for EntityStatePDUs using v1.2 DIS
protocol.

 Caveat:            Currently transmits EntityStatePDUs after removing
articulated
                       parameters.  This is due to articulated parameter
pointers
                       not surviving transmission of the PDU image over the
socket.

                    Testing to date has been exclusively on SGI wrkstations
running
                    Irix 4.0.5E operating system

 Future work:       Consider implementation as an inetd 'superserver' daemon.

                    Ensure compatibility with DIS v2.0 protocols when available.

                    Consider conversion from iterative to concurrent processing
                       if throughput performance needs improvement.

                    Initialize opposite hosts using ActivateRequest &
                       ActivateReply exchanges, as well as DeActivateRequest &
                       DeActivateReply exchanges.

                    Comments, suggestions and corrections are welcome!

VIII. WORLD-WIDE WEB (WWW) HYPERMEDIA AND MULTICAST BACKBONE (MBone)

A. Introduction

The World-Wide Web (WWW) project has been defined as a "wide-area hypermedia information retrieval initiative aiming to give universal access to a large universe of documents" (Hughes 94). Fundamentally the WWW combines a name space consisting of any information store available on the Internet with a broad set of retrieval clients and servers, all of which can be connected by easily-defined hypertext markup language (*.html*) multimedia links. This globally-accessible combination of media, client programs, servers and hyperlinks can be conveniently utilized by humans or autonomous entities. The Web has fundamentally shifted the nature of information storage, access and retrieval (Hughes 94) (Berners-Lee 94a, 94b).

Universal Resource Locators (URLs) are a key WWW innovation. A block of information might contain text, document, image, sound clip, video clip, executable program, archived dataset or arbitrary stream. If that block of information exists on the Internet, it can be uniquely identified by host machine IP address, publicly visible local directory, local file name, and type of client needed for retrieval (such as anonymous ftp, hypertext browser or gopher). Ordinarily the local file name also includes an extension which identifies the media type (such as *.ps* for PostScript file or *.rgb* for an image). Thus the URL completely specifies everything needed to retrieve any type of electronic information resource. Example URLs appear in the list of references, e.g. (Hughes 94).

The Multicast Backbone (MBone) permits several-to-many simultaneous high-bandwidth communications streams across the Internet. Detailed information on MBone applications and use appears in (Macedonia, Brutzman 94). A customized session directory (*sd*) configuration file *.sd.tcl* is provided. This configuration file adjusts the *sd* interface at run time to enable automatic DIS connection of the

underwater virtual world *viewer* and automatic spawning of a *Mosaic* browser connection to the NPS AUV WWW Home Page. Thus, once a system has been configured using free software for *Mosaic*, MBone and this project, connection to an already-running underwater virtual world requires only a single button click from any compatible workstation on the Internet. Global connectivity and ease of use are thus demonstrated in order to further encourage remote collaborative research and large-scale widely-distributed virtual worlds.

B. NPS AUV World-Wide Web Home Page

Hot links to other home pages, servers or media are portrayed by underlined text in the home page. Line breaks and page layout are handled automatically by the browser according to window and font size.

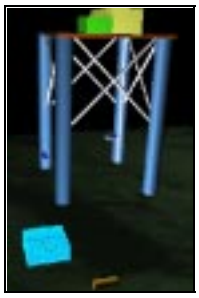
NPS AUV Underwater Virtual World



finger auv@dude.cs.nps.navy.mil for a sample mission report.

A free tar archive of the virtual world software is here: *auv-uvw.tar.Z*, including source code and executable binaries that run on Silicon Graphics (SGI) workstations.

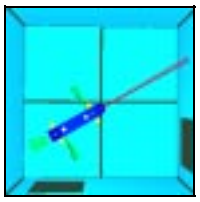
A user installation guide is available. Please let me know if you need help installing the virtual world. Research collaboration is welcome.

Here is another sample NPS AUV mission report run in the virtual world.

Additional supporting papers and programs used with the virtual world software are distributed separately:

- *"From virtual world to reality: designing an autonomous underwater robot"* paper and slides.
- **Vehicle telemetry** postscript plots (20 pages) for the SIGGRAPH mission.
- Mission script syntax for NPS AUV execution level control: mission.script.HELP file.

- **www** line mode World-Wide Web browser distribution page for the **www** anonymous ftp directory. **www** is used to make World-Wide Web queries from inside the virtual world. This program is needed if you want live text to speech capability. Put **www** in the /dynamics directory or have your system administrator install it.
- **gnuplot** plotting program distribution directory (and FAQ page). **gnuplot** is used to plot robot telemetry results. This program is needed if you want a plotting capability. Put it in the /execution directory or have your system administrator install it.
- **MBone** Multicast Backbone connection information. An MBone connection is needed if you want to participate in worldwide audio/video/DIS multicasts with the underwater virtual world. If you are a local user on the gravy cs.nps.navy.mil subnet, you don't have to download the full distribution but instead can copy the MBone session directory (**sd**) configuration file **.sd.tcl** and **.mailcap** mosaic initialization file to your root directory, and then paste the following **.cshrc** aliases into your root directory **.cshrc** file. After you **source .cshrc** you are ready to run **sd** and **mosaic**.



The **NPS AUV Underwater Virtual World** also appeared at **The Edge** exhibition at **SIGGRAPH 94**, July 26-29 in Orlando Florida USA. There was a simultaneous MBone multicast on the worldwide Internet all that week. Information resources from that exhibit include:

- project abstract,
- collaborator list,
- people pages,
- 1000-word description and proposal for exhibition in
- **The Edge** exhibition at **SIGGRAPH 94**, and
- information regarding the audio/video multicast on the Internet MBone.

ftp://taurus.cs.nps.navy.mil/pub/auv/auv.html

C. Hypertext Markup Language (HTML) Syntax Summary

The following HTML syntax summary will help decipher most of the home page document which follows in the next section. The key feature of HTML is that it describes document structure: images, the relative emphasis of text entries and links to other documents or files via URLs (NCSA 94b).

The rendered format of an HTML document can vary depending on the browser used to access it. This permits both graphics terminals and character-based terminals to each access and display a document, preserving contextual links throughout. URL media format is indicated by the filename extension. The ability to display movies, play sounds, and utilize other media depends on the capabilities of the connecting machine, the presence of 'viewer' programs which can receive and output the media after a handoff from the browser, and proper links between MIME types and browsers as configured in the user's *.mailcap* file.

The following is a short synopsis of key HTML markups. Markup tags are generally case insensitive. Blanks and skipped lines between markup tags have no effect.

See URL *http://www.ncsa.uiuc.edu/General/Internet/WWW/HTMLPrimer.html* for detailed information on HTML syntax.

<B> **bold text** </B>

<I> *italics text* </I>

<P> inserts a paragraph break.

<HR> places a horizontal rule before the next item:

<A IMG="*universal resource locator*">
places an inline image on the page.

<A HREF="*universal resource locator*"> button text>
places button text on the screen which retrieves "*universal resource locator*" when selected. Inline images can be used in place of text.
